

Reviews KFA2 GeForce GTX 1060 Card 60NH7DSL9C

2 years warranty. 3 GB of video memory - for graphics, reduce textures to high is difficult, for others, at 4 GB (rx 470) probably will be sufficient, although with copper heat pipes.

2 years warranty. 3 GB of video memory - for graphics (which need ULTRA), it is difficult to reduce textures to high, for the rest, 4 GB (rx 470) is difficult to be sufficient. The fans do not stop when idle. The radiator is still just stamped, although with copper heat pipes. In Witcher the maximum with HairWorks, it heated to 78 degrees. Although it was noisy, the fans rotated at 2000 rpm. But I have a miniATX case, it is better in a spacious case. The temperature in games is 75 degrees.

1) The accelerators are a bit noisy. But they can be heard from the case. I even noticed this only 3 months after use, so the disadvantage is insignificant 2) The plastic looks cheap, but it is irritating. In any case, it looks more or less compared to other models. This is for those who want a nice hardware. 3) 3gb, but those who chose this card in particular deliberately do so for the fact that they will have to reduce textures 1 step to low, or those who have a smaller monitor than full take the card hd
